STECSTATS COMPLIANCE EVIDENCE

YouTube API Services Architecture

September 22, 2026

1

Coach

Signs into StecStats and explicitly chooses to connect YouTube, start a live broadcast, upload a video, or disconnect.

→

2

StecStats Web & Mobile

Displays the connection and broadcast controls. User actions are sent securely over HTTPS to the StecStats API.

→

3

StecStats API Server

Handles OAuth callbacks, stores encrypted authorization tokens, and makes only the YouTube API calls needed for each coach action.

→

▶

Google OAuth & YouTube

Google obtains user consent. YouTube Data API creates and manages Live broadcasts and processes user-selected video uploads.

Authorization boundary: StecStats receives scoped OAuth authorization only after Google consent. It never receives the user's Google password.

HTTPS + encrypted token storage

Coach-initiated only

Broadcast creation, completion, and uploads require an explicit action in StecStats.

Limited API use

Connection checks, Live setup and status, broadcast completion, and selected uploads.

No advertising or sale

YouTube API data is not used for advertising, sold, or shared with unrelated third parties.

User-controlled removal

Disconnect revokes authorization and removes the stored token; account deletion removes connection data.
